Dear Support Staff;

[...stuff deleted here for breity]

- Walk mode (- button) works 100%
- Throttle lever somewhat fouled by the display when routed.

Problems:

1. Yesterday, 06/19/19: 11 mile ride PAS, ECO, 1, 2 & 3 worked well. BUT:
  - a). only after some hesitation, the throttle worked, WITHOUT PEDALLING, to 20 mph; BUT
  - b). when testing (needing!) TAB, ie, WHILE PEDALLING, it not only provided no "boost" it seemed to cut power to the motor AND, then
  - c). on releasing the throttle lever, caused a lot of drag for about three seconds.
2. Today, 06/20/19: in house
  - a). walk mode works 100% (including brake cut-off; who knew)
  - b). throttle completely inactive/inoperable.

Seems like a faulty throttle (switch)?
