

Level Terminal Installation

Last verified by Andrew Castellon on 03-06-2023

This guide will assist you with the installation of a Level terminal

In order to install the new Level terminal, you will want to first remove the battery. After doing so, please make note of the three screws located in the picture below:

With an allen/hex key, the three screws will be loosened, removed, and put to the side to be reused later.

After removing the 3 screws, the terminal (the component with the prongs) will lift out as shown here:

At this point the terminal will still be connected to the bike via a couple of cables. Please make note of the cables on your bike and swap in the new terminal attaching the new terminal to the same colored plugs as the previous terminal. You can now reinstall the 3 screws and your terminal installation is complete.
